STOCKS TWO PERCENT BELOW LAST YEAR

An estimated 63.5 million cwt of fall potatoes for all uses were held by growers, processors, and dealers on May 1, 1980. This was 2 percent below the inventory on May 1, 1979, the first year for which May 1 stocks estimates were available.

The regional totals are as follows: the seven Eastern States had 8.78 million cwt on hand, 53 percent above a year ago. Maine's holdings, at 8.0 million cwt, accounted for the bulk of the region's total and remained sharply above last season. Stocks in the eight Central States totaled 6.81 million cwt, a 19 percent reduction from the May 1, 1979 level. North Dakota trimmed inventories by 37 percent while Minnesota holdings were 4 percent below last May 1. The eight Western States held 47.9 million cwt in storage, off 6 percent from May 1, 1979. Idaho's stocks, at 29.5 million cwt, comprised well over half of the region's total and were 9 percent less than last year. Washington's holdings, below year-earlier levels for all prior months, are now 11 percent above last year's May 1 total. In Oregon, stocks were 17 percent below a year ago.

Disappearance of the 1979 fall crop to May 1, 1980 was 233 million cwt (excluding Nevada), down 8 percent from the comparable period last season. The total disappearance includes 28.5 million cwt of potatoes that were dumped during grading, fed to livestock on farms where grown, discarded without grading, and lost due to shrinkage (moisture loss).

HUME LIBRARY

MAY 27 1980

The quantity of potatoes processed to May 1, 1980 in the seven major processing States totaled 86.4 million cwt, 6 percent less than the 91.4 million cwt processed during the comparable period last season.

U.F.A.S. - Univ. of Florida

NOTE: Stocks are defined as the quantity remaining in storage for all purposes and uses, including shrinkage and waste and other losses that occur after the date of each report. Sales of fall potatoes for all purposes generally account for about 90 percent of the total fall production. Shrinkage and loss and home use account for the remaining 10 percent.

1/ STOCKS INCLUDED IN OTHER STATES.

2/ EXCLUDING NEV FOR WHICH NO STOCKS ESTIMATES ARE MADE. NEV 1978 PRODUCTION 5,440,000 CWT AND 1979 PRODUCTION 4,950,000 CWT.

POTATO STOCKS QUALITY SURVEY
MINNESOTA AND NORTH DAKOTA (RED RIVER VALLEY)

The potato stocks quality information contained in this report is based on a survey conducted by the Economics, Statistics, and Cooperatives Service in the Red River Valley of North Dakota and Minnesota. Sample bags of potatoes selected on a random basis were placed in storage at harvest time. Reports issued each month during the 1979-80 storage season have shown the cumulative average grade and weight loss for these potatoes at the time of removal from storage. At the request of the Red River Valley Potato Growers Association, samples were selected only for processing potatoes.

Samples of white varieties recovered before May 1, 1980 continue to indicate a significantly lower quality both at harvest and after storage than samples recovered by the comparable date a year earlier. The decline while in storage of white varieties grading No. 1 (including B's) was 10 percentage points for samples removed from storage to date. This compares with a 12 point decline during the same period a year earlier. The percent of white varieties graded as culls at harvest and after storage for samples recovered by May 1 is well above a year ago. Total weight loss while in storage for samples recovered to date is 5 percent, the same as last season.

Based on samples of russet varieties recovered by May 1, 1980, the quality at harvest is also indicated well below a year earlier, but after storage quality is now 1 percentage point higher than last May 1. The percentage of russet samples grading No. 1 (including B's) declined 6 points between harvest and May 1, 1980, compared with a 15 point decline during the comparable period last season. The percent of russet varieties graded as culls both at harvest and after storage is much higher this season than for samples recovered by May 1, 1979. The total weight loss while in storage this year was 6 percent to May 1, compared with a 4 percent weight loss during the comparable period last season.

The cooperation of the many potato growers and storage operators who assisted on this project is greatly appreciated.
